## AMIGACS: AMIGA Catalogue

### CATALOG

This is a multiwavelength database for a refinement of the pioneering Catalog of Isolated Galaxies (CIG: Karachentseva 1973;  $n = 1050$  galaxies) including optical, IR and radio line and continuum measures in order to characterise all phases of the ISM. For most galaxies we provide: Coordinates - Optical magnitudes - Velocities - Revised morphology - FIR Luminosities - Isolation Parameters

### Add AMIGACS to workflow

You may specify constant parameters here, or tick the *Input port* box to provide them in the workflow.

Note: **Required** parameters will always appear as input ports in the workflow if no value is provided. The service might not support all optional parameters.
